

Class vs Functional components

Functional component \rightarrow It's just a fn which return React Element.

```
function sum (a, b) {  
    return a + b;  
}
```

a & b are parameters
of sum fn

class is a blue print

```
const abc = new Class();
```

inside class in a

fn. this.props

super keyword is used to run
constructor fn of parent class

Q what is useState hook in react?

const [name, setName] = useState('name');

```
import { useState } from "react";
```

```
const Form = () => {
```

```
  const [name, setName] = useState("");
```

```
  const changeHandler = (e) => {  
    setName(e.target.value);  
  };
```

→ This fn is
re created again
& again

```
  return (
```

```
    <div>
```

```
      <input value={name} onChange={changeHandler} />
```

```
    </div>
```

```
  );
```

```
};
```

```
export default Form;
```

re render => Form();

`fn defi` ← use Callback (`fn defi`, dependency Array),

i → id = setTimeout(() ⇒ {
p api('i')
 }, 300);

i → api('i');

~~X~~ "i" at $t = 0 \text{ ms}$

✓ "ip" at $t = 200 \text{ ms}$

~~X~~ "iph" at $t = 600 \text{ ms}$

"ipho" at $t = 700 \text{ ms}$

api("ip")

\Rightarrow `debounce (fn, delay)`
